## Summary: USCG SAR

- MARCOOS is providing regional surface current observations to the Coast Guard through SAROPS
- IOOS will provide regional surface current forecasts to the Coast Guard through SAROPS
- QA/QC teams are continually testing new algorithms to further lower uncertainties of surface current and nearshore wave estimates.

# Mid-Atlantic Raw Velocities (1 Day Avg) 2007/07/20 0500 GMT

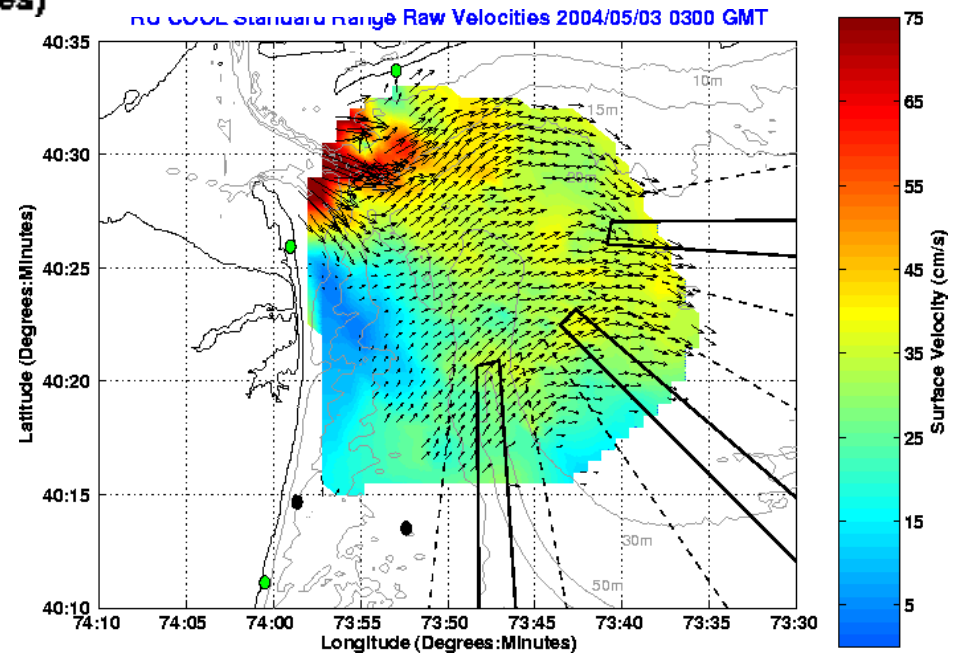

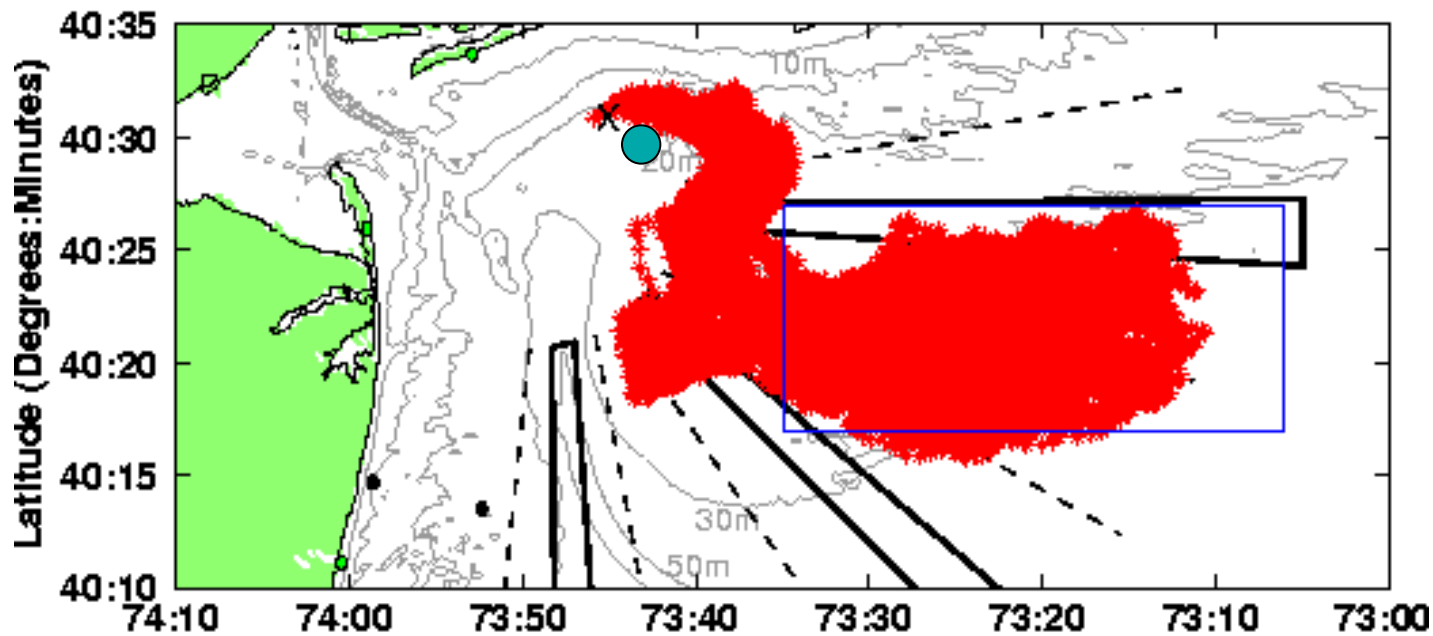

The wind switches to a more upwelling favorable direction and glider ru02 is retasked to head up toward the freshwater outflow.

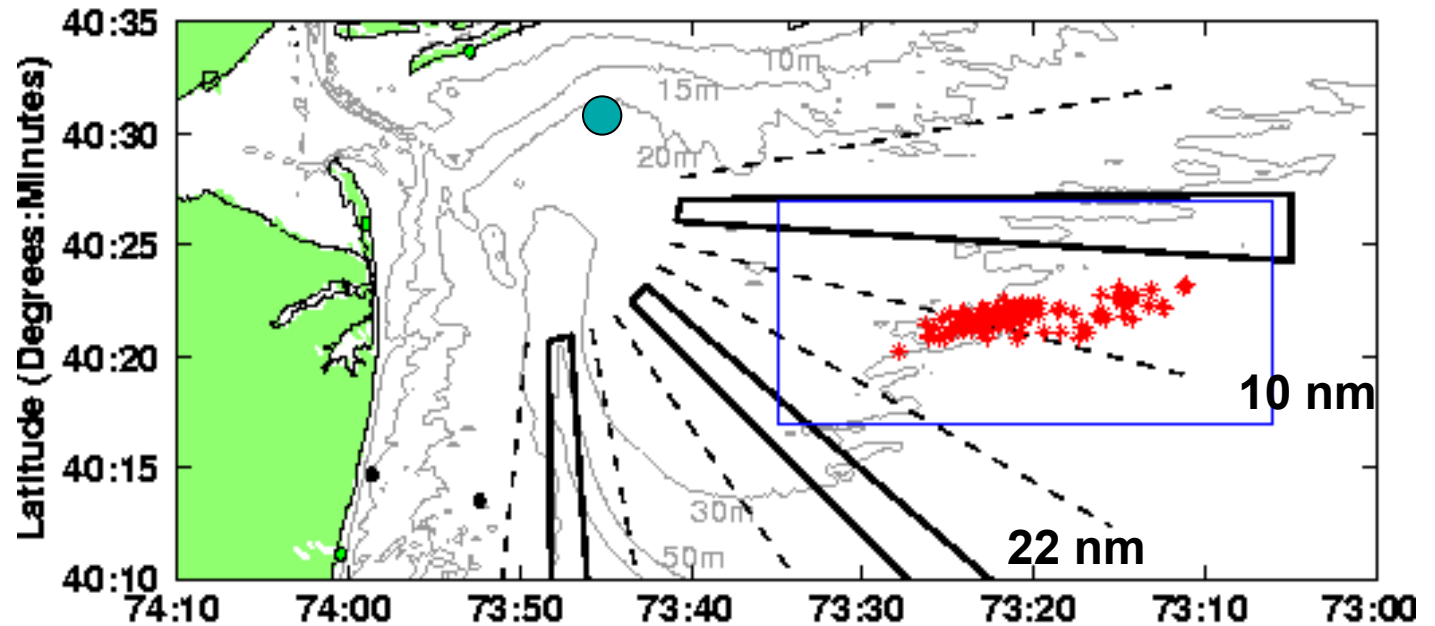

During the mission, the glider loses communication with mission control and begins to drift.

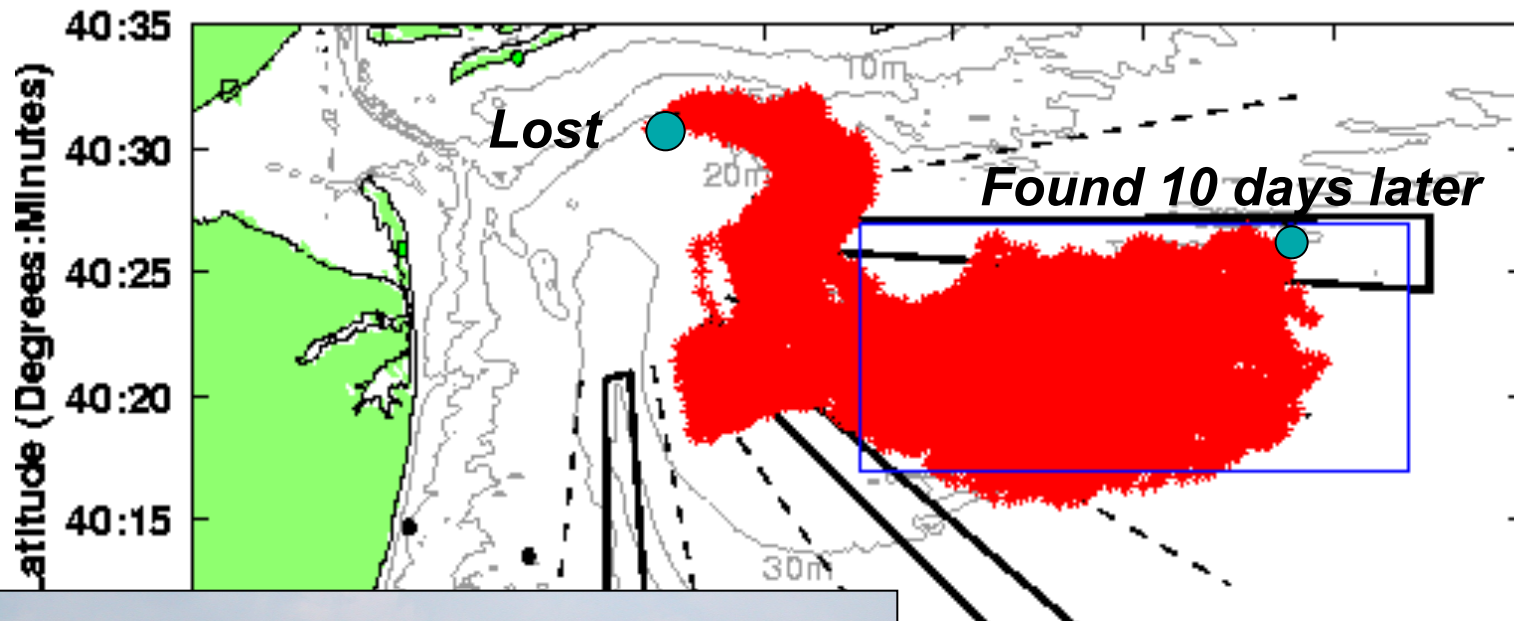

A search area is defined for the glider's probable location 10 days after communication is lost

## Nearshore Surface Oil Forecast Deepwater Horizon MC252

NOAA/NOS/OR&R **Nearshore**  
 Estimate for: 1200 CDT, Thursday, 5/27/10  
 Date Prepared: 2100 CDT, Wednesday, 5/26/10

This forecast is based on the NWS spot forecast from Wednesday, May 26 PM. Currents were obtained from several models (NOAA Gulf of Mexico, West Florida Shelf/USF, TAMU/TGLO, NAVO/NRL) and HFR measurements. The model was initialized from Tuesday evening satellite imagery analysis (NOAA/NESDIS) and Wednesday overflight observations. The leading edge may contain tarballs that are not readily observable from the imagery (hence not included in the model initialization). Oil near bay inlets could be brought into that bay by local tidal currents.

Forecast location for oil on 27-May-10 at 1200 CDT

See Offshore Forecast for trajectories of oil to the south.

**Trajectory**  
 □ Uncertainty  
 Light Blue Light  
 Medium Blue Medium  
 Dark Blue Heavy  
 X Potential beached oil

Winds are forecast to have an offshore (northerly) component through Saturday morning with magnitudes of 6-12 kts. Overflights on Wednesday observed significant amounts of oil offshore around the Mississippi Delta and near the southern Chandeleur Islands. Although offshore winds may eventually lead to a reprieve in new shoreline impacts, the Mississippi Delta west to Timbalier Bay, Breton Sound and the Chandeleur Islands continue to be threatened by shoreline contacts during this forecast period. Note that the southern extent of the oil is not included in this forecast.

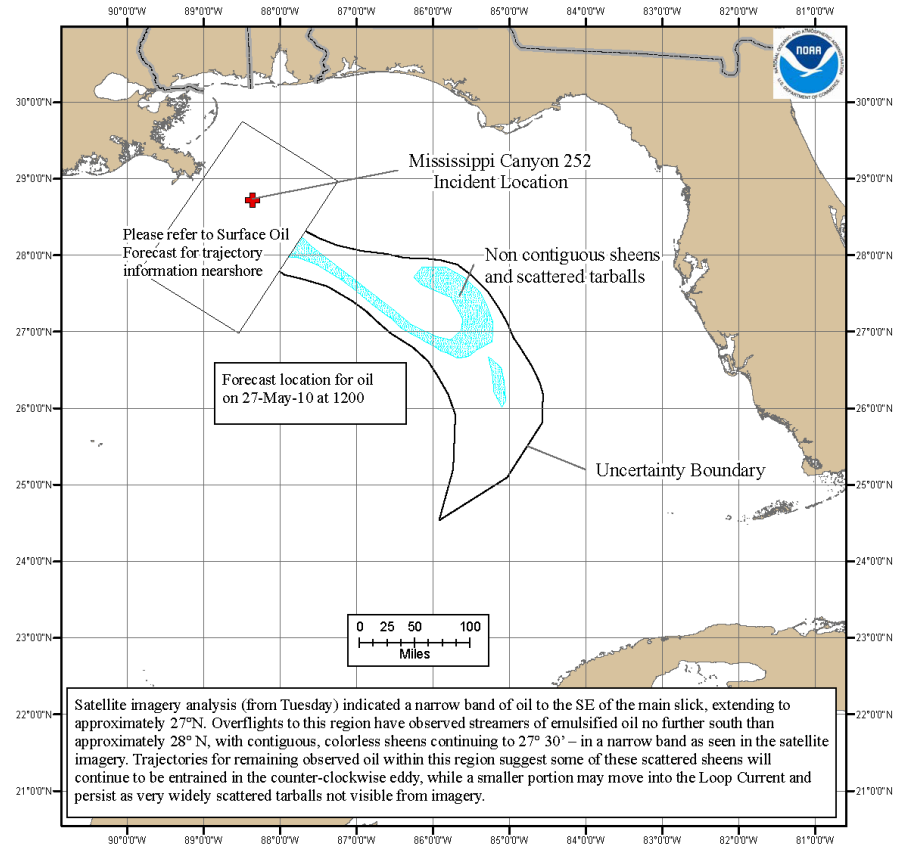

Next Forecast:  
May 27th PM

## Offshore Surface Oil Forecast Deepwater Horizon MC252

NOAA/NOS/OR&R **Offshore**  
 Estimate for: 1200 CDT, Thursday 5/27/10  
 Date Prepared: 1800 CDT, Wednesday 5/26/10

Currents were obtained from four models: NOAA Gulf of Mexico, West Florida Shelf/USF, NRL IAS/NFS and NC State SABGOM. Each includes Loop Current dynamics. Gulf wide winds were obtained from the gridded NCEP product. The model was initialized from Tuesday morning satellite imagery analysis (NOAA/NESDIS) and observations from a Tuesday morning overflight. The leading edge may contain tarballs that are not readily observable from the imagery (hence not included in the model initialization).

Please refer to Surface Oil Forecast for trajectory information nearshore

Forecast location for oil on 27-May-10 at 1200

Non contiguous sheens and scattered tarballs

Uncertainty Boundary

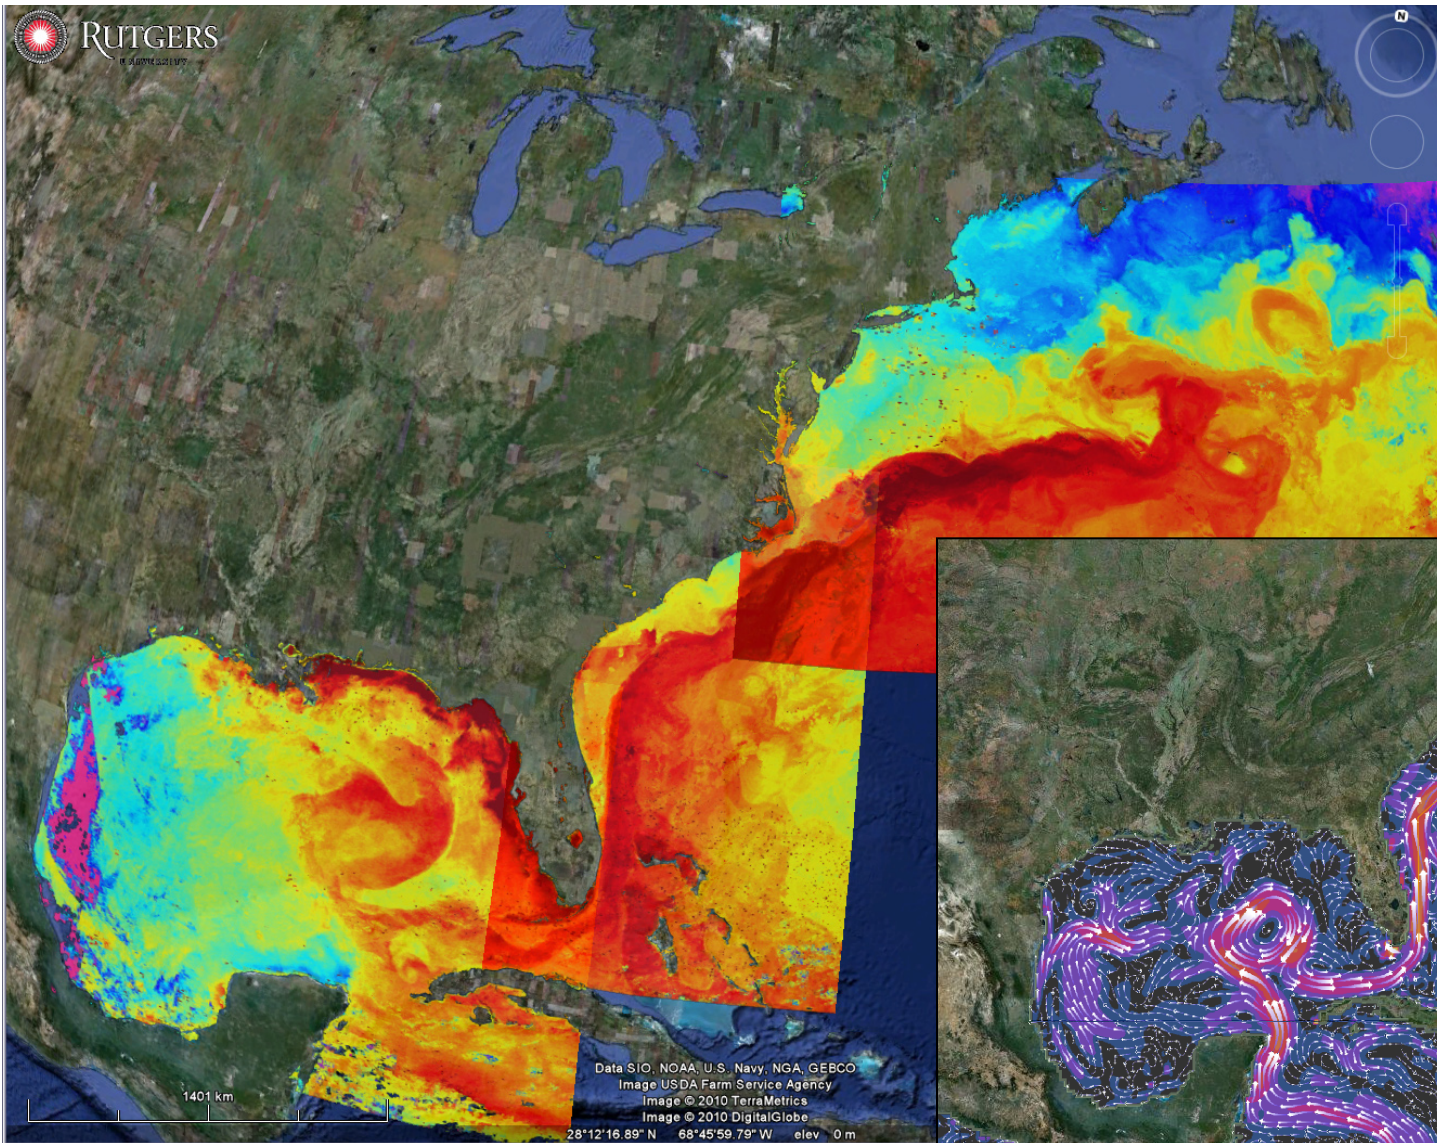

Satellite imagery analysis (from Tuesday) indicated a narrow band of oil to the SE of the main slick, extending to approximately 27°N. Overflights to this region have observed streamers of emulsified oil no further south than approximately 28°N, with contiguous, colorless sheens continuing to 27° 30' - in a narrow band as seen in the satellite imagery. Trajectories for remaining observed oil within this region suggest some of these scattered sheens will continue to be entrained in the counter-clockwise eddy, while a smaller portion may move into the Loop Current and persist as very widely scattered tarballs not visible from imagery.

Next Forecast:  
May 27th PM

## Summary: Floatables

- Surface current maps provided by a nested HF radar network can support ocean observatory operations.
- Floatable events within the nearshore region have been tracked using these surface currents.
- Scenarios run with HF radar operations and assimilative circulation models guided decision making in response to catastrophic events.

## Summary: Fisheries

- Ocean observatories capture the dynamics of marine habitats
- Species in the MAB respond to dynamics of the surface ocean (i.e. Divergence) captured with an HF radar network.
- Mechanistic models linked to physical models **co-developed with scientists, managers, and the industry** may support fisheries assessment and management through.
